

APPLE POLLINIZERS AND APPLE POLLINATION CHART

Plantings which do not use varieties providing adequate cross pollination should use one of the following varieties for a secondary pollen source. Pollinizers should be placed every fifty feet and staggered in adjacent rows. Contact your **ACN** representative for recommendations for your specific needs.

CHESTNUT

An excellent pollinizer for early to mid-season bloom cultivars. Trees are medium in vigor and slightly upright, with large white blossoms. The large size fruit is marketable for use in preserves or decorations.

MANCHURIAN

Early to mid-season bloom corresponding with Red Delicious. Flowers white and large. Tree very vigorous and upright.

SNOWDRIFT

A mid-season to late blooming variety, often used to pollinize Red Delicious. Bloom is white, flowers small. Fruits are salmon egg sized and yellow with orange cheek.

HYSLOP

Common crab apple used for jellies and also in cider where tannin content is desired. Flavor is tart and moderately astringent. Fruit matures in mid-September and is 1 to 1-1/2" diameter, is long stemmed, and has a red blush over a cream background. Selection is useful as a pollinizer for early to mid-season blooming varieties, though care must be taken to avoid biennial bearing, which reduces effectiveness as a

pollen source. Tree is medium in vigor, precocious, with moderate resistance to fire blight.

SPUR WINTER BANANA

Excellent pollinizer for Red Delicious. Spur-type growth makes tree compact with little maintenance required. Tree begins bearing at an early age. Annual defruiting of tree will optimize return bloom.

INDIAN SUMMER

A flowering crab apple pollinizer for the late season bloom. Indian Summer produces abundant pink flowers with viable pollen over an extended period.
